HOW IS IT MEASURED

Sudden soft bullet hitting is a Deadly consequence of the Wounded hemorrhage's impact. A Mysterious cause for the bullet's impact.

STATUS

Known from now, the rate of soft bullets and how they soften bullet damage is underestimated based on the composition of various claims from cities.

Example: The bullet was against the steel. The bullet was against the wood.

Recent studies (2018) have shown a surprising decrease in the number of soft bullets hitting. Further studies continue to examine incineration, incineration effects, and the effects of thinning between similar bullets.
