OVERVIEW

OHI+ ASSESSMENTS AT ANY SCALE

Independent assessments are via mailed questionnaires that allow for comparison of standard information across an array of practices and programs. These studies are used for managers to identify and prioritize the delivery of good practices at the local and regional levels, and management decisions are made.

In independent assessments, teams examine data from the global assessment, test their own practices and conduct independent investigations. These data lead to the development of program evaluation tools and protocols, which produce more accurate and reliable data collection methods, and in-depth studies of global health. These studies are available on the web at www.ohi-science.org, and we encourage the development of such assessments and in-depth studies of global health. These studies are available on the web at www.ohi-science.org, and we encourage the development of such assessments and in-depth studies of global health.

WHY CONDUCT AN OHI+ ASSESSMENT?
