THE 2019 GLOBAL OCEAN HEALTH INDEX

The Global Ocean Health Index is an international tool that synthesizes data from multiple sources and is designed to assess the health of the world’s oceans. The Index provides a comprehensive overview of ocean health across five key areas: Water Quality, Ecosystem Health, Marine Resources, Human Activities, and Ocean Governance.

The Index is developed in collaboration with a network of global experts from various scientific disciplines. It uses a standardized methodology to assess ocean health against a set of indicators that reflect the state of the ocean in each of the five key areas.

The Index was launched in 2013 and has been updated annually since then. It is intended to be a transparent and robust tool for tracking ocean health trends and informing policy decisions aimed at improving ocean health.
