THE 2019 GLOBAL OCEAN HEALTH INDEX

The Global Ocean Health Index is an annual report that assesses the state of the ocean health on a scale of 0-100. It is calculated using 11 indicator groups and 36 indicators that cover a wide range of ocean health metrics.

The index for 2019 was calculated using a score of 71. This indicates a moderate level of ocean health, with areas for improvement in some regions.

The index highlights the importance of sustainable fishing practices, as well as the need for improved water quality and marine conservation efforts.

The report calls for increased awareness and action to protect the ocean's health, which is crucial for the well-being of the planet and its inhabitants.
